

Terminal 5 Heathrow Project 2

CT Glass provided bespoke glazing solutions for two separate projects on the prestigious Terminal 5 project.

Background

A client recommended CT Glass to work for a glass and glazing company to produce wall cladding for Airside Offices within Heathrow Airport: Terminal 5.

Project Information

To meet specification for style, design and usage, CT Glass met the Contractor onsite and carried out extensive factory testing to achieve the desired look.

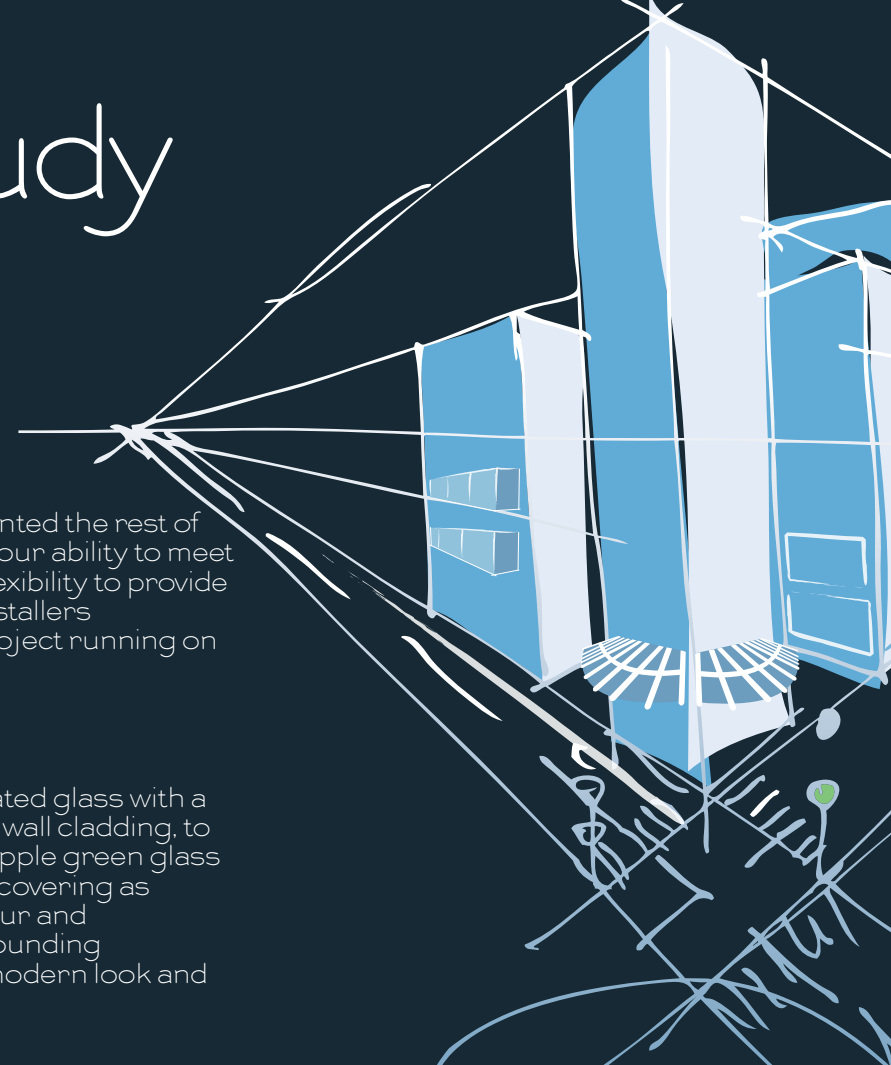

Why CT Glass?

Whilst we normally work with specialist installers we are also approached by other glazing companies for complex projects where additional skill or technical processing capability is required. In this case it was

important that the cladding complimented the rest of the environment. CT were chosen for our ability to meet exacting specification demands and flexibility to provide multiple samples for designers and installers pre-manufactured to help keep the project running on time and ensure smooth installation.

Results

CT Glass used two thickness of laminated glass with a white interlayer to create 11.5mm thick wall cladding, to compliment both a separate painted apple green glass used elsewhere in the offices and wall covering as specified. As well as matching the colour and successfully blending in with the surrounding environment, the cladding created a modern look and easy maintainable surface.
